It may serve both to defend against local infection and to prevent access of foreign antigens to the general immunologic system.
MISCELLANEOUS: This immunoglobulin belongs to the IgA-G subclass It was isolated from a rabbit homozygous FOR A2, N80, DE12, 15, F71, G75 heavy chain haplotype.
SIMILARITY: Contains 2 immunoglobulin-like domains.
                                                                                                                                                                                                                                                        597
                                                                                                                                                                                                                                                                                                          542
                                                                                                                                                                                                                                                                                 192

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the mutant chain is proposed. SIMILARITY: Contains 3 immunoglobulin-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MISCELLANEOUS: M511 chain was isolated from a myeloma protein that binds phosphorylcholine.
MISCELLANEOUS: M511 sequence was compared with that of mouse MOPC 47A, and a genetic mechanism for the deletion of the CH3 domain of the mutant chain is proposed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FUNCTION: Ig alpha is the major immunoglobulin class in body secretions. It may serve both to defend against local infection and to prevent access of foreign antigens to the general

IsoId=P97797-3; Sequence=VSP_007031;
spinal cord, cerebellum and spleen, and at much lower levels in kidney, thymus, heart, lung and liver. Within the cerebellum, highly expressed throughout the molecular layer, and in synaptic glomeruli in the granule cell layer. Detected in neurons of the hippocampus and dentate gyrus, and in olfactory bulb. Not detected in Purkinje cells. Highly expressed in the plexiform layers, optic fiber layer and the outer segments of the photoreceptor layer in the retina. Highly expressed in macrophages. Isoform 3 is detected at very low levels in all tissues tested.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 as docking protein and induces translocation of PTPN6,
PTPN11 and other binding partners from the cytosol to the
plasma membrane. Supports adhesion of cerebellar neurons, neurite
outgrowth and glial cell attachment. May play a key role in
intracellular signaling during synaptogenesis and in synaptic
function. Involved in the negative regulation of receptor tyrosine
kinase-coupled cellular responses induced by cell adhesion, growth
factors or insulin. Mediates negative regulation of phagocytosis,
mast cell activation and dendritic cell activation. CD47 binding
prevents maturation of immature dendritic cells and inhibits
cytokine production by mature dendritic cells (By similarity).
-!- SUBUNIT: Binds FTPN11 when tyrosine-phosphorylated, except in
macrophages, where it primarily binds PTPN6. Binds GRB2 vitro.
Binds FGR. Binds JAK2 irrespective of its phosphorylation status
and forms a stable complex. Binds SCAP1 and/or SCAP2. The
resulting complex recruits FYB. Binds PTK2B (By similarity).
-!- SUBCELIULAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FUNCTION: Immunoglobulin-like cell surface receptor for CD47. A as docking protein and induces translocation of PTPN6, as docking protein and induces translocation of PTPN6, as docking protein and induces translocation of PTPN6.

PTPN11 and other binding partners from the cytosol to the plasma membrane. Supports adhesion of cerebellar neurons, neuri outgrowth and glial cell attachment. May play a key role in intracellular signaling during synaptogenesis and in synaptic function. Involved in the negative regulation of receptor tyrosine kinase-coupled cellular responses induced by cell adhesion, growth factors or insulin. Mediates negative regulation of phagocytosis, mast cell activation and dendritic cell activation. CD47 binding prevents maturation of immature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Binds JARZ irrespective of its phosphorylation status and forms stable complex. Binds SCAP1 and/or SCAP2. The resulting complex recruits FYB. Binds FGR and PTK2B (By similarity).

SUBCELLULAR LOCATION: Type I membrane protein.

TISSUE SPECIFICITY: Highly expressed in spleen macrophages. Detected in skin dendritic cells.

PTM: Phosphorylated on tyrosine residues (By similarity).

SIMILARITY: Contains 2 immunoglobulin-like C1-type domains.

SIMILARITY: Contains 1 immunoglobulin-like V-type domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               dendritic cells and inhibits cytokine production by mature dendritic cells (By similarity).

SUBUNIT: Binds PTPN11 when tyrosine-phosphorylated, except macrophages, where it primarily binds PTPN6. Binds GRB2 in Binds JAK2 irrespective of its phosphorylation status and its phosphorylation status and its phosphorylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Y11045; CAA71942.1; -.
